The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytoctoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene
                                           variant (7463A) DNA fragment. The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as toxins for gene

The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cyctocxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

용

```
Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                     NSI; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; ds.
                                                                                             Parvovirus non-structure protein 1 (NS1) wild-type DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (DEKR-) DEUT KREBSFORSCHUNGSZENTRUM.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a DNA encoding parvovirus non-structure protein (NSI) variant (1934A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on O6-ANG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The present sequence is a wild type DNA encoding parvovirus non-structure protein 1 (NS1). The present invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               relative to control
disease in animals,
                                                                                                                                                                                                                                      Polypeptide obtd. by recombinant DNA methods - for vaccination against parvovirus infections in man and animals.
                                                                                                                                                                                                                                                                                                                         The inventors claim an immunologically active polypeptide for the development of vaccinal immunity against parvovirus infection. Also claimed are DNA sequences wholly or partly duplicative of defined sequences. The polypeptides are used in vaccines for conferring protection against parvovirus infections in man and animals. The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

The DNA is preferably derived from vBI440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM3Z or pGEM5Z. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or canine A72 cells
preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM32 or pGEMS2. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or canine A72 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Parvovirus; dog; vaccine; CPV; myocardial disease; enteric disease; ds;

They have one or more of the sequence alterations indicated in the sequence relative to the sequence of a control (5th passage) wild-type CPV-2b (see AAT88320).

A claimed virus from the 65th passage) wild-type CPV-2b (see AAT88320).

C contains all 6 mutations. The DNA from attenuated CPV strains (see also AAT88324) is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks which, in turn, can be transfected into cells to generate master stocks which, in turn, can be transfected into cells to generate master stocks cof the virus. The attenuated viruses can be used in dogs as a vaccine to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strains of types 2 and 2a), providing a long term immune response. (NB. this sequence was created by adaptation of the wild-type CPV-2b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

```

```
This DNA sequence comprises an attenuated virus genome derived by serial passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate CC 39 in Nurs feline kidney host cells. The attenuated virus is designated vB1440 (ARCC WR 2489). It contains 4 mutations relative to the sequence (see AAT88320) of the control (5th passage) wild-type CPV-2b. 2 Mutations are within the hairpin formed by the 3' terminal palindrome: the mutation at nucleotide 59 introduces and into a G-C rich region within the tip of the hairpin, disrupting the base palining in one of the 2 small internal candacent to the mismatched bubble (flip-flop) sequence within the cadacent to the mismatched bubble (flip-flop) sequence within the palindrome. The DNA from attenuated CPV trains (see also AAT88321) is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dogs as a vaccine to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant stransfected), providing a long term immune response.

C (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1656 GGACAAACAATTAGAATTGATCAAAAGGTAAAGGAAGTAAGCAAATTGAACCAACTCCA 1715

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAT88320
```

```
Recombinant DNA construct comprising a plant centromere, useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant son animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors,
                                                                                                                                                                                                                           (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors,

                                                                                                                                                                                                                                                                                                                                   This DNA sequence comprises the genome of virulent canine parvovirus type (CPV-2b) isolate 39, obtained after 5 serial passages in NLFK feline kidney host calls. Putther passaging has yielded attendated virus vB1440 (ATCC VR 2489) (See AAT88124) from the 60th passage, and a claimed virus (see AAT88121) derived from the 65th passage, and a claimed virus (see AAT88121) derived from the 65th passage (ATCC 2528). These crespectively contain 4 and 6 mutations in comparison to the virulent 5th passage virus. The DNA from attenuated CPV-2b strains is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The crement of viruses can be used in dogs as a vaccine to protect against cattenuated viruse and mink enteritis virus. The vaccines protect edine panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strains of types 2 and 2a), and provide a long term immune response. (Updated on 17-0CT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors, cytokines, antibodies, and growth factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 95223 BP; 27974 A; 19452 C; 19355 G; 27745 T; 0 U; 697 Other;

Sequence 244546, Application US/10027632

Publication No. US20020198371A1

GENERAL INFORMATION:

APPLICANT: Wang, David G.

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

TITLE OF INVENTION: Dolymorphisms in the Human Genome

FILE REFERENCE: 108827.129

CURRENT PAPLICATION NUMBER: US/10/027,632

CURRENT APPLICATION NUMBER: US 60/18,006

PRIOR FILING DATE: 2000-07-12

PRIOR FILING DATE: 2000-04-20

PRIOR FILING DATE: 2000-04-20

Not I; Site 2: Sal I; The library was prepared by Catherine S. Lee and has not been published. The pancreas was obtained from Gerard Gradwoll (PNAS 97 P1607-1611, 2000). The cDNA's were prepared with an oligo containing a NotI site, and Sall linkers were added to the ends. The inserts were cut with NotI before being cloned into the NotI-Sall sites in the vectors. This is one of two libraries, ngn3 wt and ngn3 -/-. The wt library is in pSPORTI, T7 promoter is 5'."

Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

Disclosure; Page 30; 41pp; English.

The present sequence is a peptide fragment of parvovirus non-structure protein 1 (NS1) variant (T463A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is parvovirus non-structure protein 1 (NS1) variant (T463A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                              (T394A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                    The present sequence is parvovirus non-structure protein 1 (NSI) variant
Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The present sequence is a parvovirus wild-type non-structure protein 1 (NS1). The present invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and
                                                                                                                                                                         Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NS1; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; mutant; mutein; variant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is parvovirus non-structure protein 1 (NSI) variant (T363A). The invention relates to the variants of the parvovirus nonstructure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotxcicty activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

                                                                                                  ò
                                               The present sequence is parvovirus non-structure protein 1 (NS1) variant (S283A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The inventors claim an immunologically active polypeptide for the development of vaccinal immunity against parvovirus infection. Also claimed are DNA sequences wholly or partly duplicative of defined sequences. The polypeptides are used in vaccines for conferring protection against parvovirus infections in man and animals. The present invention relates to method for producing peptides, polypeptides, or proteins having a predetermined property. The method comprises (a) producing a population of sets of polymuclectide sequences that encode modified forms of a target protein, (b) introducing each set of polymucleotide sequences into host cells and expressing the encoded protein, where the host cells are present in an addressable array, and protein, where the host cells are present in an addressable array, and conseful in performing high throughput directed evolution of peptides and proteins, particularly those that act in complex biological settings, by rainants and for titering viruses. ABU97391-ABU97952 represent Adeno associated virus (AAV) mutant rep proteins used as an exemplification of the method of the invention. Note: The sequence data for this patent did electronic format directly from WIPO at the was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
Producing proteins with a predetermined property comprises introducing nucleic acids encoding a modified target protein into host cells and expressing and screening for proteins with different activity than the target protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to method for producing peptides,

CC omprises (a) proteins having a predetermined property. The method

CC comprises (a) producing a population of sets of polymucleotide sequences

CC that encode modified forms of a target protein, (b) introducing each set

CC of polymucleotide sequences into host cells and expressing the encoded

CC (c) individually screening the sets of encoded proteins. The method is

CC protein, where the host cells are present in an addressable array, and

CC protein, where the host cells are present in an addressable array, and

CC rational matagenesis. The method is also used for generating protein

CC rational matagenesis. The method is also used for generating protein

CC variants and for titering viruses. ABU97391-ABU97952 represent Adeno

associated virus (AAV) mutant rep proteins used as an exemplification of

CC the method of the invention. Note: The sequence data for this patent did

CC form part of the printed specification, but was obtained in

CC ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                              Producing proteins with a predetermined property comprises introducing nucleic acids encoding a modified target protein into host cells and expressing and screening for proteins with different activity than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mutant; mutein; adeno-associated virus; AAV; anti-HIV; gene therapy; Rep 78; human papilloma virus; HIV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel adeno-associated virus (AAV), comprising an uncleic acid encoding the sequence comprising 19-621 amino acids, given in the specification. A virus of the invention has anti-HIV activity, and may have a use in gene therapy. The protein used in the invention is Rep Ps protein. The AAV is useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection. The present sequence is used in the exemplification of the invention.

a nucleic acid encoding the sequence comprising 19-621 amino acids, given in the specification. A virus of the invention has anti-HIV activity, and may have a use in gene therapy. The protein used in the invention is Rep 78 protein. The ApV is useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New library of fusion nucleic acids each encoding a Rep protein recognized by a nucleic acid modification enzyme and a candidate protein, useful for detecting protein-protein interactions, protein drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fusion nucleic acid library; Rep protein; tumour cell; apoptosis; nucleic acid modification enzyme; cell death; decreased cell growth; protein-protein interaction detection; cell division; cancer therapy;
                                                                                                             New adeno-associated virus, useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection.

```

This sequence is the goose parvovirus NS1 protein. The invention relates

```
to a library of fusion nucleic acids, each encourny a new process. Candidate protein, a presentation structure, a targeting sequence or a label. The Rep protein is a nucleic acid modification enzyme. The random or directed libraries (including the cDNA libraries) can be introduced into any tumnour cell, and peptides identified which by themselves induce compositions may also be used to detect protein-protein interactions, protein drug discovery, particularly for protein drugs that interactions, protein drug discovery, particularly for protein drugs that interactions, protein drug discovery, particularly for protein drugs that conterned with targets on cell surfaces, to discover DNA or nucleic acid modification enzymes with decreased toxicity for the host cells, to dentify or generate Rep proteins with decreased toxicity, improved contents attachment sequences for use in expression vectors and in content cander therapy and in the content cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander cander can

cector (with a fusion of nucleic acids encoding the enzyme and candidate vector (with a fusion of nucleic acids encoding the enzyme and candidate protein respectively), an enzyme attachment sequence (BAS; RNA sequence), where the candidate compound and candidate protein are different and BAS and the enzyme are covalently linked. The NAP conjugates are useful in screens to assay binding to target molecules and/or to screen candidate agents for the ability to modulate the activity of the target molecule. They are useful in cancer therapy. Sequences of the invention are also useful to detect protein-protein interaction, in drug discovery, to discover DNA or nucleic acid binding proteins, using nucleic acids as the targets and to screen for NAM enzymes with decreased toxicity for host care also useful in pharmacogenomic studies, for screening bioactive agents on surface cells, viruses and microbial organisms. They are also useful for screening proteins causing phenotypic changes such as alter attachment, infectivity, etc. of the virus. Sequences of the invention are also used in gene therapy. The present sequence is Goose parvovirus NSI protein used in the invention

Disclosure; Page 199-201; 246pp; English.

The present invention relates to a novel method of generating a library of fusion nucleic acids. The method involves providing a computationally-derived library of candidate protein sequences and creating a library of expression vectors containing a fusion nucleic acid having a sequence

a candidate protein acid modification (NAM) enzyme and a sequence encoding a candidate protein sequence from the library and an enzyme attachment sequence [RAS) that is recognised by the NAM enzyme. The invention also relates to the use of a variety of computation methods including protein dusion nucleic acids that may be used in treating cancer or infections, in detecting protein-protein interactions, discovery of DNA or nucleic acids that may be used in treating cancer or infections, in detecting protein-protein interactions, discovery of DNA or nucleic acid binding proteins, protein drug discovery, screening for NAM enzymes with decreased toxicity to the host cells and NAM enzymes/EAS pairs with increased affinity or in pharmacogenetic studies. The invention is also used in gene therapy. The present sequence is Goose parvovirus NS1 protein. This sequence is used to illustrate the method of the invention 8899999999998888

New library of prokaryotic pET-24a expression vectors, host cells or nucleic acid/protein conjugates, useful for screening candidate proteins and their nucleic acids or modification enzymes for pharmacogenetic analysis

Disclosure, Fig 31; 127pp; English.

The invention relates to methods and compositions for the construction of prokaryotic libraries expressing candidate proteins and the use of these libraries to identify candidate proteins and the nucleic acids encoding them. The invention provides a library of prokaryotic pET-24a vectors comprising a fusion nucleic acid consisting of a nucleic acid encoding a nucleic acid modification (NAM) enzyme or a candidate protein, or a nucleic acid acid acid encyment operably linked to the NAM enzyme or the candidate protein, and an enzyme attachment sequence (EAS) recognised by the NAM enzyme. The library is used for identifying candidate proteins and nucleic acids encoding these proteins, in screening for NAM enzymes

with decreased toxicity for the host cells, or in identifying novel or improved EASs, which may be used for understanding cellular processes or any subsequent thrarapeutic or toxic activities. The nucleic acid/protein (NAP) conjugates are useful in diagnostic assays and in research including clinical pharmacology, functional genomics, pharmacogenomics, agricultural chemicals, environmental safety assessment, chemical sensor, nutrient biology, cosmetic research or enzymology. These may also be used in in vitro screening techniques and in assays with target molecules. The present sequence is Goose parvovirus NSI protein used in the invention 88888888888

Carlson J., Rushlow K., Maxwell I., Maxwell F., Winston S., Hahn W.;
"Cloning and sequence of DNA encoding structural proteins of the autonomous parvovirus feline panleukopenia virus.";
J. Virol. 55:574-587(1985).
-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                              J. Virol. 70:2508-2515(1996).

-!- CATALVITC ACTIVITY: 1-(5-phosphoribosyl)-5-[(5-phosphoribosylamino) methylideneamino] imidazole-4-carboxamide = !
[(5-phosphoribosylamino) methylideneamino] -1-(5-phosphoribosyl) imidazole-4-carboxamide.
-!- PATHWAY: Histidine biosyrthesis; fourth step.
-!- SATHWAY: Histidine biosyrthesis; fourth step.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the hisA / hisF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description
